IPv6 for Enterprise Networks Shannon McFarland 2011-04-01 IPv6 for Enterprise Networks The practical guide to deploying IPv6 in campus, WAN/branch, data center, and virtualized environments Shannon McFarland, CCIE® No. 5245 Muninder Sambi, CCIE No. 13915 Nikhil Sharma, CCIE No. 21273 Sanjay Hooda, CCIE No. 11737 IPv6 for Enterprise Networks brings together all the information you need to successfully deploy IPv6 in any campus, WAN/branch, data center, or virtualized environment. Four leading Cisco IPv6 experts present a practical approach to organizing and executing your large-scale IPv6 implementation. They show how IPv6 affects existing network designs, describe common IPv4/IPv6 coexistence mechanisms, guide you in planning, and present validated configuration examples for building labs, pilots, and production networks. The authors first review some of the drivers behind the acceleration of IPv6 deployment in the enterprise. Next, they introduce powerful new IPv6 services for

routing, QoS, multicast, and management, comparing them with familiar IPv4 features and behavior. Finally, they translate IPv6 concepts into usable configurations. Up-to-date and practical, IPv6 for Enterprise Networks is an indispensable resource for every network engineer, architect, manager, and consultant who must evaluate, plan, migrate to, or manage IPv6 networks. Shannon McFarland, CCIE No. 5245, is a Corporate Consulting Engineer for Cisco serving as a technical consultant for enterprise IPv6 deployment and data center design with a focus on application deployment and virtual desktop infrastructure. For more than 16 years, he has worked on large-scale enterprise campus, WAN/branch, and data center network design and optimization. For more than a decade, he has spoken at IPv6 events worldwide, including Cisco Live. Muninder Sambi, CCIE No. 13915, is a Product Line Manager for Cisco Catalyst 4500/4900 series platform, is a core member of the Cisco IPv6 development council, and a key participant in IETF's IPv6 areas of focus. Cisco VIRL Hands-On Lab Guide Jack Wang 2018-10-25 ABOUT THE HANDS-ON LABS The purpose of this workbook is to guide you through configuring and testing common network topologies using Cisco Virtual Internet Routing Lab (VIRL). Cisco VIRL is a software tool to build and run network simulations without the need for physical hardware. The hands-on labs in this guide work you through basic STP, Trunking, NAT, EIGRP/OSPF dynamic routing protocols to advanced ASA with multiple security zones, IPSec VPN, BGP, DMVPN, VRF and MPLS configurations. The Lab Guide helps you: Get Proficient with Cisco VIRL Practice using Real-world Scenarios Mock-up Build CCNA, CCNP and CCIE Level Labs Step-

by-step and Easy-to-follow Guide The knowledge and proficiency acquired by completing the labs in this workbook will help you in preparing CCNA, CCNP and CCIE level exams, as well as in administrating and configuring real-world networking environment. Most importantly, get proficient at using Cisco VIRL as a tool to build any network topologies you like. Lab configuration is broken down into smaller tasks. Each task represents a key technology that often appears in certification exams and real-world networking environment. In most cases, a prior task configuration is required before configuring the next. Make sure test after each task is completed and in working state. Instead of diving into the configuration right away, we explain what the technology is about and why we proposed such solution. Key configuration and commands are highlighted for your attention and explained in depth. One of the objectives of the workbook is to get your proficient with Cisco VIRL. Whether you are a veteran engineer working in an enterprise network environment or a Cisco academy student learning about networking technologies, you need a lab. The step-by-step guide demonstrates and walks you through 9 network topologies, from easy to advanced, by using Cisco VIRL as a backend simulation engine. VIRL also has extensive ability to integrate with third-party virtual machines, appliances, VNFs and servers such as Microsoft Windows, Juniper, Palo Alto Networks, Fortinet, F5, Extreme Networks, Arista, Alcatel, Citrix and more. In some of the labs, we have introduced Linux virtual machines to run inside a routing lab. And use the Linux hosts to perform Ping and Traceroute testing. You'll learn how to build a Linux machine and assign interface IP address and a default gateway. Result validation commands and troubleshooting tips are included within each task. It is a crucial skill to have in real-life network engineering and CCIE lab takers. You'll learn what troubleshooting tools and commands to use for each scenario, and what outcomes to expect. VIRL built-in live visualization tool is often leveraged to verify traffic path of a Traceroute command. You may also shutdown specific network interfaces or any node on the network to simulate a failure condition. Subsequent traffic fail-over can be verified by examining the Ping and Traceroute results. To learn about how to get started with Cisco VIRL and how to acquire a license,

prepare and build a server, refer to our in-depth guide "The VIRL BOOK: A Step-by-Step Guide Using Cisco Virtual Internet Routing Lab". Available on Amazon.com For more information visit:
